

Improvements:

- Worth noting that this is a prototype, an illustration of potential improvements to the website, not a fully functional new website
- Explains the problems and then directly states the solutions
 - Clearly outlines the inefficiencies, risks, and limitations of traditional blood banking.
 - Immediately follows each problem with a direct, concise explanation of how Ocularmed's robotic system solves it
- Name explanation:
 - Explicitly explains the origin and meaning of the name.
 - Clarifies that Ocularmed focuses on precision, automation, and medical robotics, not eye-related products
 - Removes ambiguity and strengthens brand identity.
- Added images to the website to improve attractiveness of website –
 - Note – images are placeholder images, aware that they aren't correct
- Increased clarity on some points – e.g., how to request pilot and what that means
- New logo
 - The previous logo was simple and didn't fully communicate the company's identity. The new logo:
 - Is more visually appealing
 - Better reflects the brand's focus on medical robotics and precision
 - Uses colour and shape to create a stronger, more memorable identity
 - This strengthens brand recognition and professionalism.
- Less empty space
 - A fuller site builds trust and makes the business appear more robust and legitimate

Reinventing Blood Banking Infrastructure

Ocularmed is an Enviro-Health medical technology company developing climate-aware, AI-driven robotic blood banking systems. Our platform reduces NHS blood wastage using FIFO/FEFO algorithms, stabilises supply chains through centralised inventory intelligence, improves temperature integrity with smart monitoring systems, and lowers lifecycle CO₂ emissions through non-DEHP blood bags. A single robotic platform stores all blood components, reducing the need for multiple refrigerators and lowering overall hospital energy consumption.

Advancing Blood Management Solutions

Why Ocularmed?

The name "Ocularmed" represents our focus on building a national inventory where we can observe all blood banks to increase efficiency.

What do we do?

Ocularmed integrates robotics, artificial intelligence, thermal imaging, and sustainable consumables into a single intelligent blood banking infrastructure designed to reduce wastage, stabilise supply chains, and lower lifecycle carbon impact.

The Current Problems - and our Solution

High Wastage

In 2024 alone, the NHS lost £12.29 million worth of blood, millions of blood bags, due to expiry, handling failures, and temperature instability. Our system will improve the efficiency, reducing this wastage.

Safety Risk

Manual storage and retrieval increase the risk of mis-issue, delays and compliance failures. The current system involves excessive human-based admin, such as writing on every blood bag, which is solved by our QR-code-based system.

No Central Database

Hospitals lack real-time visibility of inventory, usage trends, and shortages across sites. Without shared inventory intelligence, blood movement across the system is reactive rather than planned. Our system creates a shared system for storing and managing all blood components - RBCs, plasma, platelets and all blood groups.

Our Business Model

Hardware Systems Robotic blood bank infrastructure may be deployed free or at minimal cost initially to accelerate adoption.	SaaS Analytics AI software subscriptions provide monitoring, forecasting and decision dashboards.
Consumables Long-term supply of non-DEHP blood bags creates recurring revenue.	Maintenance & Training Paid maintenance, calibration and training services support deployed systems.

Request a Pilot

Submit the inquiry form to get a pilot program in your hospital
